

AMENDMENTS TO THE SPECIFICATION

In paragraph [0007] please amend as reflected in the following marked-up version of the paragraph:

[0007] The present invention mitigates cross-site scripting attacks by evaluating HTTP requests at the server before dynamic rendering of the response is performed. In one embodiment, this is done by examining the HTTP request for script constructs that may indicate a cross-site scripting attack. If a script construct is discovered, then the server computer can abort the HTTP request before the cross-site scripting attack can be completed. The server, for example, can generate an error instead of serving the HTTP request, generate an error event, and the like. Preventing a cross-site scripting attack may also include encoding user input including the script construct to render the script inert.
